

Aesthetic and Functional Control Of Posterior Cad/Cam Restorations

Dr. Julian Caplan, UK

Patients have become more discerning about the type of dentistry they desire. Posterior indirect restorations have historically required considerable skill by the dentist and technician to produce clinically acceptable results from both the dentists' functional and biological point of view but often from patients ever increasing aesthetic requirements. Dr. Caplan will discuss the latest developments in Cerec Cad/Cam technology and material science and show how these developments allow a simple work flow for the dentist to achieve excellent restorations with minimal effort.

Included in this presentation will be

- "Biogeneric" tooth anatomy
- Design techniques for quadrant restorations
- Overview of current Cad/Cam materials available and porcelain bonding concepts
